

DPT- The Triple Shot Cocktail

DIPHTHERIA, which means “grey membrane” was an old time disease in which infection of the tongue and throat formed a grey membrane. Robert Mendelsohn, MD...”there is about as much chance of dying from a cobra bite as there is diphtheria”.

Diphtheria, like smallpox and polio, is virtually gone due to improved sanitation, hygiene and clean water supplies. And the cases of Diphtheria are from the vaccine.

Then why are we still giving children 5 shots?

PERTUSSIS: Whooping Cough is another disease of overcrowding, poor sanitary conditions and malnutrition. Famous epidemics were in 1578, 1695 and the late 1850’s killing tens of thousands. As conditions improved the diseases declined dramatically. 95% resolve in the US prior to the introduction of the vaccine.

Pertussis is the most controversial of American vaccines. This component of the DPT cocktail has caused more adverse reactions and deaths than any other vaccine. The only safety test done on this vaccine.....1940 researchers injected the vaccine in mice. If the mice continued to gain weight, it was assumed it was safe from mass human inoculations. That’s it.

TETANUS: Caused by anaerobic bacteria due to puncture wounds. Death is caused by unremitting spasm of the jaw, back, diaphragm and finally choking. It, as well, was on a steep decline prior to the vaccine being introduced.

THE TRIVALENT COCKTAIL: DPT

When vaccines are mixed together, they activate each other to be more potent resulting in more dangerous. Viral interference is the term. These 3 vaccines have NEVER been tested for safety together and as a result this cocktail has caused more adverse reactions and deaths than any other combination, thus far.

REACTIONS CONNECTED TO THE DPT COCKTAIL

Permanent Neurological Damage
High Pitched Screaming
Brain Fever(Encephalopathy)
SIDS (Sudden Infant Death)
Guillain-Barre

Vomiting
Convulsions
Anaphylactic Shock
Death

ENTER “DTaP”

By 1996 so many adverse reactions were being pinned on the Pertussis component that the “acellular pertussis” was introduced and hawked as the “safer” component because it contained no whole bacterial cells. The only problem is that it still contains enough by products of the bacteria that it still triggers adverse reactions and remains #1 for vaccine injuries.

Did you ever wonder what happened to all those millions of doses of DPT that were deemed dangerous, stockpiled in storage when DPaT came out? NOTHING. They are still being used, despite the known damage they create, because they were approved previously or they jet them off to Third World Markets. Really!

Australian researcher Viera Scheibner, PhD stumbled upon the link between DPT and Sudden Infant Death Syndrome while developing a breathing machine with her husband to prevent SIDS. What they found was a 16-day crisis pattern following DPT injections that was unmistakable and validated by the Tennessee 200 and a 1983 Los Angeles County Coroners office study correlating SIDS with DPT.

75% OF THE \$2 BILLION IN VACCINE DAMAGES PAID OUT SINCE 1991 HAS BEEN AWARDED FOR REACTIONS TO DPT.

80% of children under 5 who got Pertussis, had been fully vaccinated.

Shaken Baby Syndrome: The neurological pictures of SBS babies are identical to reactions from the DPT vaccine:

Intracranial Hemorrhage
Cerebral Edema
Subdural Hematoma
